

## Zeroing

Zeroing is the act of aligning your point of aim (what you're aiming at) and your point of impact (where the bullet fired out of your gun is actually hitting) at a specific distance. The reason behind aligning your POA and POI is simple, it allows you to fire a shot at a known distance and be able to accurately hit where you're aiming on that target, animal, etc.

Whether you're new to firearms or just someone that wants to brush up on the right way to dial in your scope or red dot sight, we're going to give you the ins and outs of zeroing an optic to your rifle.

\*Please make sure you always follow the four rules of firearms safety especially when using this guide.
